

# RECOMMENDATIONS AND FURTHER RESEARCH STUDIES

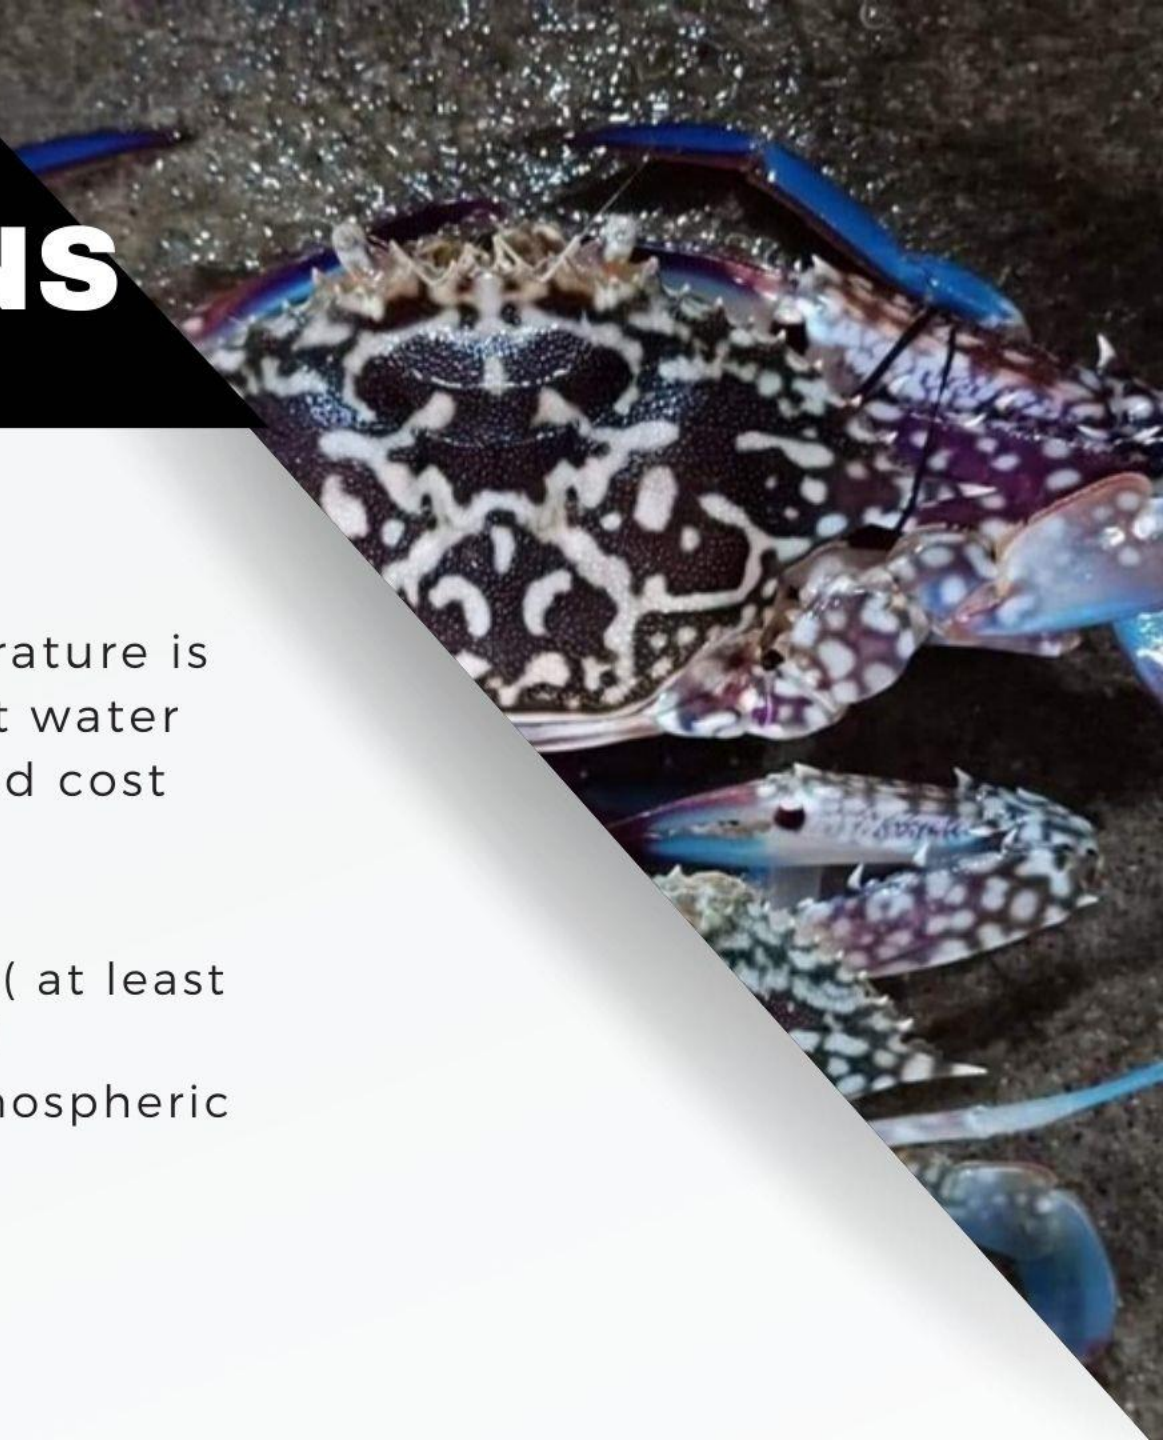

# RECOMMENDATIONS

When rearing baseline temperature is 30 degree celsius but ambient water temperature is rather ideal and cost effective

When rearing use bigger tanks ( at least 10 Tons Capacity) and enclosed production area to prevent atmospheric temperature fluctuation

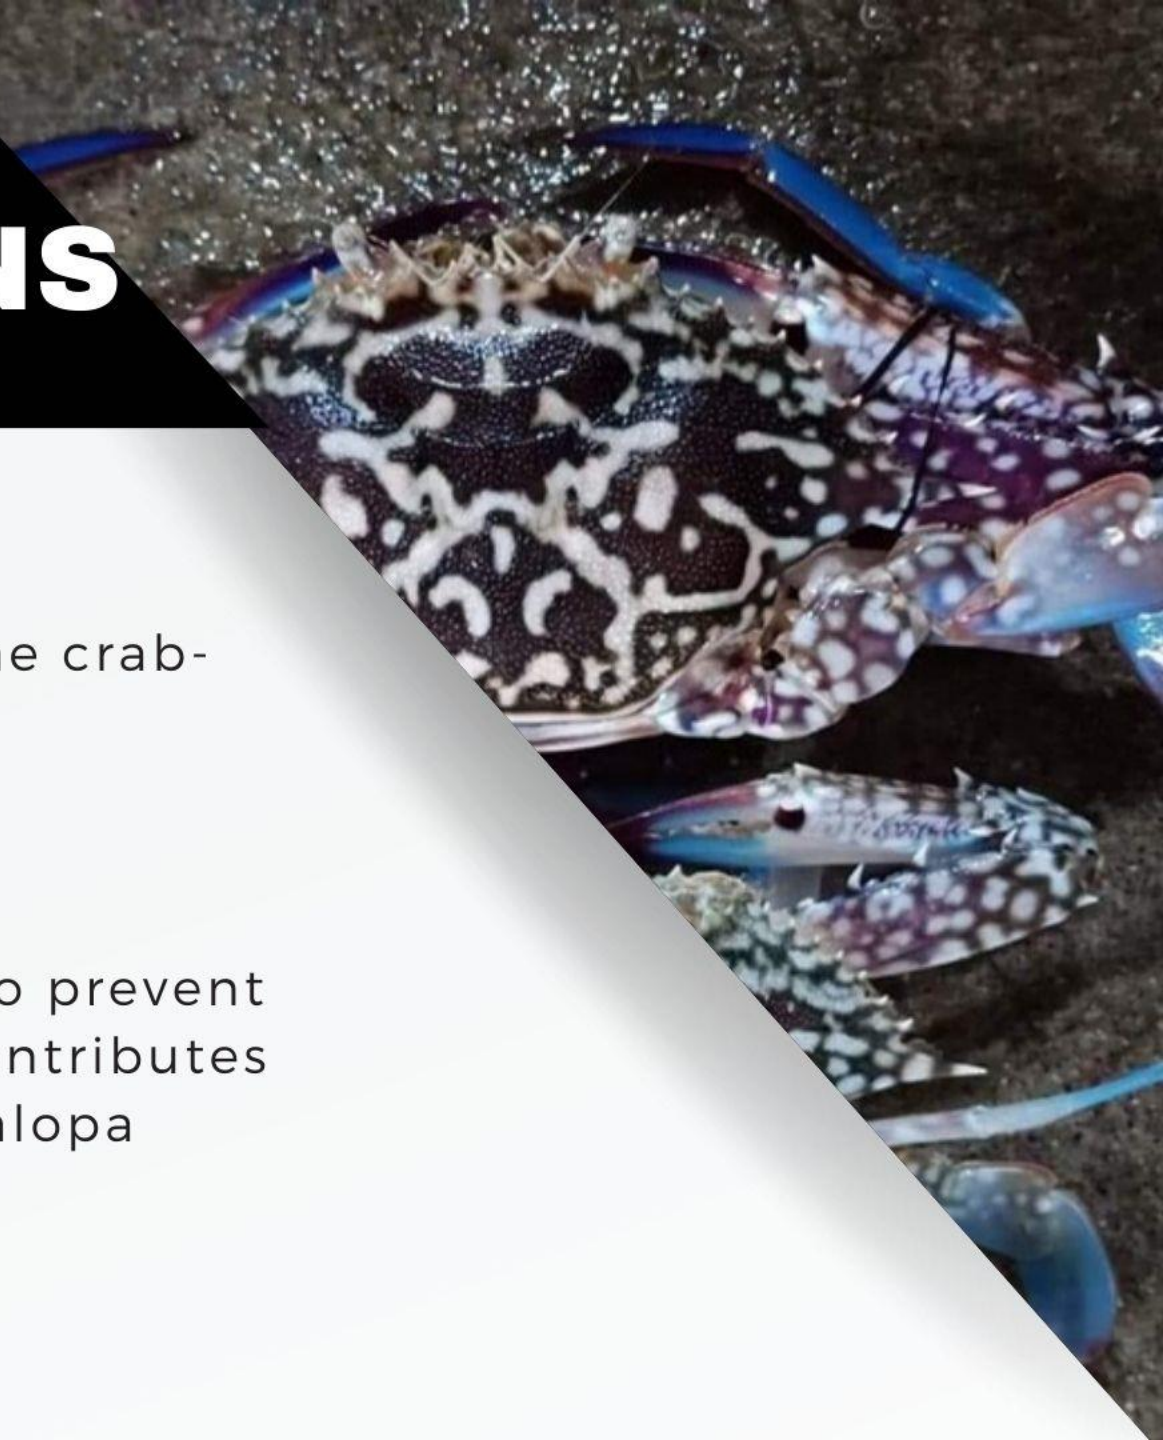

# RECOMMENDATIONS

Situate the production in the crab-producing areas

Improve filtration systems to prevent bacterial infestation that contributes to high mortality rate (Megalopa stage to instar)

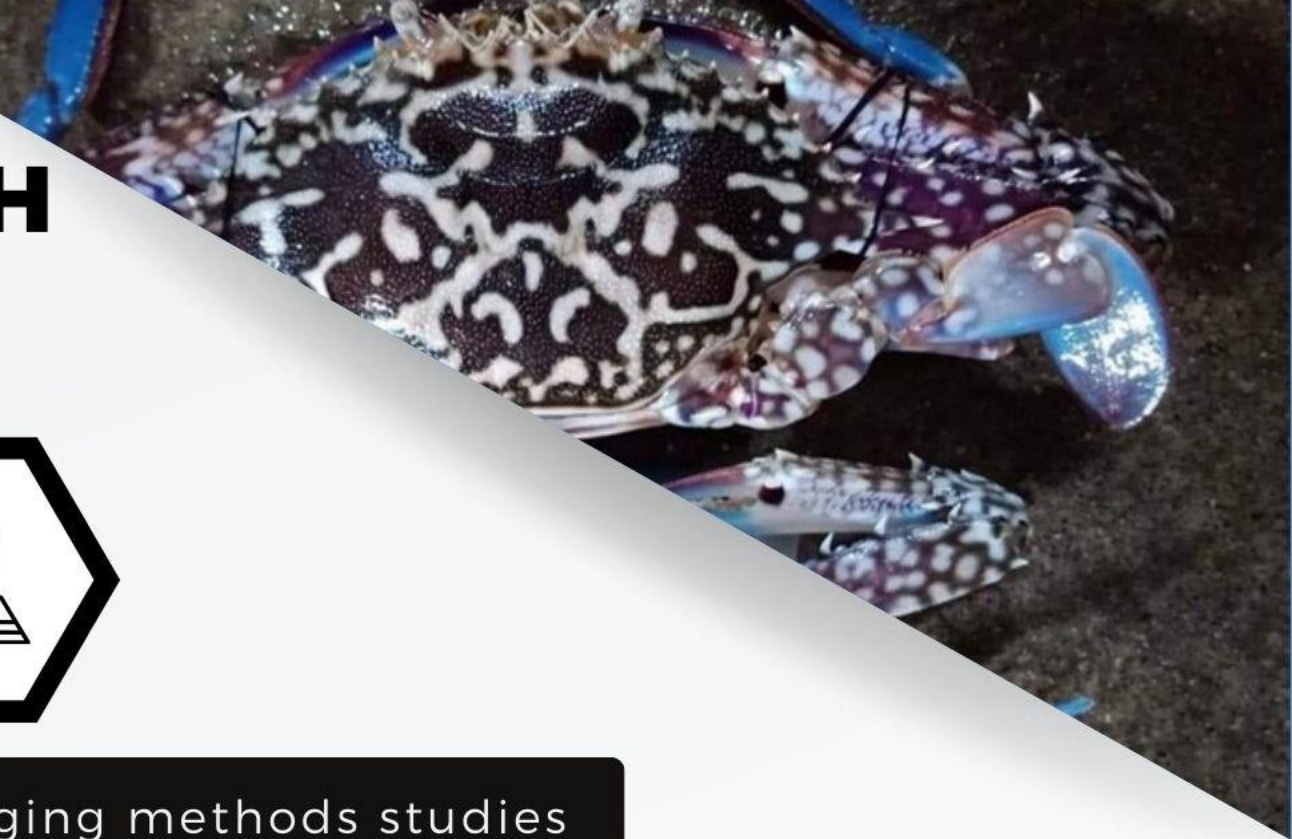

# FURTHER RESEARCH STUDIES

Mark and recapture studies

Tagging methods studies

Site characterization studies for release area

# FURTHER RESEARCH STUDIES

Genetic studies related to release of stocks

Sites characterization studies
